Summary

Product engineer with 10+ years across SaaS, education, creator, event, and marketing platforms. Started in design and frontend; now full stack, from UI to usage pipelines and billing.

I work on growth engineering: lifecycle surfaces, usage-based billing, analytics, and experiments. I use customer context, data, and AI-assisted development to get from idea to a live change faster.

Selected Impact

- Led growth work across onboarding, activation, monetization, usage-based billing, and experiments.
- Built customer-facing dashboards, notification systems, billing migration tooling, and enterprise security surfaces.
- Built internal tools and AI-assisted workflows that shortened billing, entitlement, observability, CI, and account-state investigations.

Experience

Webflow

Senior Software Engineer
Aug 2022 to Present

- Led lifecycle and growth engineering across dashboard surfaces, paywalls, usage visibility, notifications, and customer-facing product development.
- Launched Webflow's first AI tooling in 2023.
- In 2026, built an internal admin MCP platform with about 20 tools covering billing, entitlements, account state, payments, observability, CI, and internal systems. Support and engineering use it to trace customer-account issues across multiple sources of truth.
- Rebuilt bandwidth metering and overage lifecycle workflows. Accurate usage pipelines, customer notifications, dashboard visibility, and billing reconciliation supported about $6M in annual incremental revenue.
- Took Webflow's per-site Web Application Firewall from an early proof of concept to production. A basic blocker became a configurable customer-facing rule system, tied to an estimated $4M self-serve opportunity and later enterprise adoption.
- Shipped usage dashboard improvements for new pricing and packaging, self-serve upgrades, and role-based access for agency and enterprise businesses, contributing to an estimated $5M ARR lift.
- Built migration, logging, and defensive cache tooling around entitlement and subscription data, so product and engineering had cleaner signals for billing and lifecycle experiments.

MasterClass

Senior Software Engineer
Apr 2022 to Aug 2022

- Worked on growth: payments, promotions, subscription conversion, experiments, and a Next.js migration.

HitRecord

Senior Developer
Jul 2019 to Apr 2022

- Led frontend modernization and growth engineering during the platform relaunch, including Optimizely experiments for the Class Projects launch.
- Worked on Angular frontend and Rails backend performance, reducing time-to-interactive and improving search on the consumer social app.

Plink.ai

Software Engineer
Sep 2018 to Jul 2019

- Built TypeScript, React, server-rendered pages, and Node API features for marketing and asset management.

Event Farm

Software Engineer
Sep 2015 to Sep 2018

- Led a rewrite of the legacy frontend into Angular while keeping the existing AngularJS and jQuery app running.
- Built ticket management and visual page-building tools for responsive web experiences.

Act-On

Solutions Engineer
Jun 2012 to Sep 2015

- Delivered customer-facing implementation support and built WYSIWYG email, form, and webpage editing tools.

Projects

Codable

Founder & Developer
Jun 2017 to Present

- Built and maintained a Safari-native iOS developer tool for inspecting, debugging, and testing web content on mobile devices.

Open Source

Contributor
Jul 2020 to Present

- Contributed to developer-tooling open source projects.

Education

University of California, Davis

B.A. Communication and Political Science

Technologies

TypeScript, JavaScript, React, Next.js, Node.js, Ruby on Rails, Angular, SwiftUI, Zod, Nest.js, SQL, Druid, Stigg, Knock, Statsig, Datadog, Braintrust, MCP, Codex, OpenCode, Git, analytics instrumentation.
